

Here is the gapto which is an association in ghana's homepage. <https://www.gaphto.org/> it is a wordpress application and we need to migrate it to a more maintainable and modern platform without losing the data and functionality. later on i will provide the database so that we can migrate it, but for now we will have to scrape the data from the existing website and import it into a new database. i have docker and docker compose setup so we can setup a postgres database, keeping in mind that we will migrate the database later.

right now our focus is to scrape the data from the existing website and build a showcase for the representatives of what we intend to build in the future.

all necessary functionalities will have to be migrated. including the cms part of wordpress. but focus on the organizational needs.

so initially do a complete plan and assess the current website and let's plan how we can get the data for this showcase and start building it with nextjs 16, i will setup that project if needed. typescript shadcn. we will have to plan the dashboard wichi will be a permission based roles and permissions system. so review the site and let's plan how we can get the data for the showcase.

phases

homepage implementation

focus on best ui and animations to show modern webpage.

modern webpage courosel idea for the noticed or announcements and news on the page.

the features that app will have

news

announcements

events

you are going to be an expert project manager, you will review the implementation, make sure your agents have the context in a file that you can reference to them and they can even update it when they are done. do as much as information relay via these files that you reference to avoid token overusage. so the important information of the project do not have to be researched again and again. this instruction is important do not write code, instead take the role of a expert project manager, you will have available to you two worker agents that will carry out the tasks you will assign.

and you will share the task for both agents make them share context with you to avoid context duplication and token overusage.

next check their implementaions request review if necessary and i will past it forward

membership login and management

cd /home/kelib/Desktop/moreprojects/gaphto && bun dev

Test login: member@gaphto.org / Test1234!

let's review how we can implement the GIS feature to know the location of members by map.

let's add a learning platform feature to the dashboard. review the app implementation and propose how these features can be added.

let's add newsletter and notifcation by email to members features to the dashboard.

make the dashboard sidebar retractable and genuinely useful for the user. add edit feature for the user profile and password reset and those.

For the team members add a link for more about them or their profile. there should be a place to manage that on the dashboard and there is but we should allow their social media links to be added and displayed.

The join gaphto link should be replaced with login link for members instead with the appropriate role.

the content editing page is not well planned. here it is targetting just two pages. let's go wild and rather build a page builder that will handle some of those pages what do you htink? how should we proceed about this? make suggestions.
